## How to use the DCS Documentation System

The matrix below indicates all available product documentation and its corresponding order numbers on its left columns as well as all existing DC Drive systems on its top rows. System descriptions, Technical data and Operating instructions (as far as they are available for the corresponding drive) are the basic documents and will be delivered together with each drive. All other documentation has to be ordered separately.

9.4 Residual current detection ..... III 9-8
9.5 EMC Filters ..... III 9-10
Appendix A ..... III A-1
Optical cables ..... III A-1

We recommend to use both, System Description plus Technical Data at the same time in case you are planning and engineering your drive.

You will find all necessary technical information in there to solve your problem.

## 1 Quick Guide

## General remarks

The term "DCS thyristor power converter" is a general designation for basic DC converters from ABB. This term can be found in many parts of the relevant documentation. The precise product name in accordance with the brief descriptions given below characterizes a specific unit.

## Brief description of DCS 500B

The DCS 500B unit range is an enhancement developed from the DCS 500 range.
The DCS 500B is an armature converter with the following standard features:

- Design and commissioning tools - Monitoring functions - Communication via databus • Human-machine interface • More than 300 additional functions blocks programmable under Win-
dows • Graphical Application Designer • Plain text display • FOR HIGH POWER

## Brief description of DCF 500B

With software release 21.232 or higher DCS 500B has a ' 3 -phase field exciter mode'. A DCF 500B is a threephase field exciter based on the programmable DCS 500B software and the SDCS-CON-2 control board.
The interface board PIN-1x is modified; - an overvoltage protection unit DCF 505/506 is required.

## Brief description of DCS 600

The DCS 600 converter family is based on the hardware developed for the DCS 500B type. Instead of a COM-x board, the SDCS_AMC_DC board is used. PC tools will be connected there, as well as the APC (Application controller), if the APC is used as a PLC. If a different PLC is used, separate adapter modules are needed. They must be connected to the AMC-DC board, too. The software code always begins with S15.xxx for MultiDrive or S18.xxx for Crane drives.

## Brief description of DCF 600

The DCF 600 unit range is intended to be used for supplying motor fields and is based on the hardware and system configuration of the DCS 600 unit. The software is identical to the DCS 600 software. Similar to DCF 500B units the DCF 505/506 overvoltage protection unit is required. The same modification is applied to the PIN-1x board, compared to DCF 500B.

Brief description of DCS 400
The DCS 400 is the smallest drive in its class. The compact design has been partly achieved by a fully integrated field exciter based on IGBT technology. A commissioning wizard - available on the control panel and the PC tool - makes start-up of the drive easy. In addition, the DCS 400 contains application macros.

### 1.1 DCS 500B (Armature)

This functional overview of DCS 500B components makes it easy to find detailed technical data in the corresponding chapters.

III 1-2

### 1.2 DCF 500B (Excitation)

III 1-3

### 1.3 DCS 600 (Armature)

III 1-4

III 1-5

### 1.5 DCS 400 (Armature and Excitation)

Remark:
All detailed information about the DCS 400 DC drive you can only find in the DCS 400 Manual (documentation no. 3ADW 000 095).

III 1-6

## 2 Converter modules

DCS 500 / DCS 500B / DCS 600 / DCF 500B / DCF 600
Unit range type DCF 500B and DCF 600 for output current of up to max. 520 A available
2.2 Fuses - installed inside the converter (Size A5, C4) ............................ III 2-12
2.3 Cross-sectional areas - Tightening torques ........................................... III 2-14
2.4 Power losses

III 2-16

## Note:

For clearness the type designation in this chapter is shown in the following way:

| Designation | is valid for |
| :--- | :--- |
| DCS 500 | DCS 500B |
|  | DCS 600 |
|  | DCF 500B |
|  | DCF 600 |

### 2.1 Dimensions

## DCS 500 valid for DCS 500B / DCS 600 / DCF 500B / DCF 600

Module C1
DCS 50x-0025
DCS 50x-0050
DCS 50x-0075
Dimensions in mm Weight appr. 7.6 kg

Fig. 2.1/1: Dimension drawing C1-Module

Module C1
DCS 50x-0100
DCS 50x-0110 DCS 50x-0140

Dimensions in mm Weight appr. 11.5 kg

Fig. 2.1/2: Dimension drawing C1-Module
III 2-2

Busbars in mm: $25 \times 3$

Fig. 2.1/3: Dimension drawing C2-Module

Busbars in mm: $30 \times 5$

Module C2
DCS 50x-0450 DCS 50x-0520

Dimensions in mm Weight appr. 29 kg

Fig. 2.1/4: Dimension drawing C2-Module

Module C2
DCS 50x-0680
DCS 50x-0820
DCS 50x-1000
Dimensions in mm Weight appr. 42 kg

Fig. 2.1/5: Dimension drawing C2-Module

C2 680 b.dsf

Terminal cover
The plastic protection cover for C2b serves as a protection against electric shock for the five high-power terminals at the lower end of the converter. It is equipped with a hole on each side, which will snap-in during mounting at a press-in nut at each side panel of the converter.

Busbars in mm:
DC $80 \times 10$
AC $60 \times 5$

Fig. 2.1/6: Dimension drawing A5-Module

* 3 drill holes to fix the CDP312 panel on the cover; panel to be connected electrically via panel extension cable (3 m)

## Mounting the converter module A5 inside an enclosure

Two supports should be mounted inside the enclosure in such a way, that they can carry the converter's weight when placing the converter later on. The minimum distance between the supports should not be less then 480 mm because of electrical clearance (DC busbars).

A L-shape support as indicated will allow to place the converter temporarily close to the front end of the support (weight still taken by a lifting device) and then push it back to the back plate of the enclosure. The upper and lower holes in the back plate of the converter should be used to fix the converter in that position.

DCS 500 valid for DCS 500B / DCS 600

Module A6 DCS 50x-1903 DCS 50x-2053 DCS 50x-2503 DCS 50x-3003

Dimensions in mm Weight appr. 180 kg

## Air entry

from the front, right, left and back

* 3 drill holes to fix the CDP312 panel on the cover; panel to be connected electrically via panel extension cable ( 3 m )

Fig. 2.1/7: Dimension drawing A6-Module (as delivery state)
III 2-6

## DCS 500 valid for DCS 500B / DCS 600

## Mounting the converter module A6 inside an enclosure

The converter is designed to be placed on a bottom plate or similar and then fixed on top to the enclosure's back plate to avoid movements to the front, right or left side. In addition to that the converter should be fixed at the bottom using two brackets in front of the elongated holes.

## Cooling air entry

The cooling fan takes the air from the backside, both sides and from the area underneath the converter module.

Fig. 2.1/8: Cooling air flow

## Power cable connection

The power cable connection is performed via Terminal option 01 for A6. This option consists of five right angle copper busbars and five times four screws. The mechanical details are shown by the figure below.

Fig. 2.1/9: Right angle copper busbar
When mounting the right angle busbars or connecting cables directly please make sure the right screws are used. The converter module is equipped with a blind hole and a nut at its end. Because of that the length of the remaining threads is limited to 35 mm (see drawing below).

Fig. 2.1/10: Length of remaining threads

Free space around the converter module
optimum

Fig. 2.1/11: Free space

## Cooling air outlet

To avoid circulating air inside the enclosure it is recommended to make sure the exhaust air leaves the enclosure.

Fig. 2.1/12 gives an example, how the right angle busbars can be mounted in case all cable connections are still made at the left side of the converter module. This results in four layers for the power cables.

In case the AC or DC connection or perhaps both of them have to be made at the right side of the converter module use the space behind the converter and move the power terminals via a right angle busbar up to that point where the final connection is most suitable. In this case the busbars need to be fixed at the cubicle / enclosure, not at the converter module! Fig. 2.1/13 gives a rough example, how a right side connection can be made

Fig. 2.1/12: Right angle busbar connection

Fig. 2.1/13: Example right side connection

Cable entries

Fig. 2.1/14: Cable entries

DCS 500 valid for DCS 500B / DCS 600

Module A7
DCS 50x-2053 xxxL DCS 50x-2603 xxxL DCS 50x-3303 xxxL DCS 50x-4003 xxxL DCS 50x-4803 xxxL DCS 50x-5203 xxxL

Dimensions in mm Weight appr. 315 kg

Fig. 2.1/15: Dimension drawing A7-Module (left-hand connection)
III 2-8

Busbars in mm: AC and DC $100 \times 10$

* 3 drill holes to fix the CDP312 panel on the cover; panel to
be connected electrically via panel extension cable ( 3 m )

Fig. 2.1/16: Dimension drawing A7-Module (right-hand connection)

## Mounting the converter module A7 inside an enclosure

This type of converter module uses the same fixing principles as described for converter module A6!

## Cooling air entry

The cooling fan takes the air from the backside, left and right side and from the area underneath the converter module.

View from bottom

Fig. 2.1/17: Cooling air flow

## Free space around the converter module

Do not place the converter module in a corner. In case the fan cannot take the air through the bottom plate of the enclosure non of the remaining entries has to be blocked.

Fig. 2.1/18: Free space

## Air entry through bottom plate

Make sure the converter module gets clean air, because there is no air filter in front of the fan at the converter.
Cooling air outlet
To avoid circulating air inside the enclosure it is recommended to make sure the exhaust air leaves the enclosure.

## Cable entries

The cable entries are existing symmetrically on both sides. Nevertheless only the entries on the left side should be used for cables going to the electronics power supply (SDCS-POW-1) or the controller board (SDCS-CON-x).

Fig. 2.1/19: Cable entries

### 2.2 Fuses - installed inside the converter

DCS 500 valid for DCS 500B / DCS 600

| Converter type | Model | Fuse F1 | Size | Type |  |  |

## Remark:

Given dimensions may be exceeded in some cases. Please take them only for information.

### 2.3 Cross-sectional areas - Tightening torques

## DCS 500 valid for DCS 500B / DCS 600 / DCF 500B / DCF 600

Recommended cross-sectional area to DINVDE 0276-1000 and DINVDE 0100-540 (PE) trefoil arrangement, up to $50^{\circ} \mathrm{C}$ ambient temperature.

| Converter type | C1, D1 (AM1, KM1) |  |  | U1, V1, W1 (AK1, AK3, AK5) |  |  | PE |  |  |

(1) Reduced ambient temperature $40^{\circ} \mathrm{C}$
(2) Option for more flexible cable connection available

Table 2.3/1: Cross-sectional areas - tightening torques

You will find instructions on how to calculate the PE conductor's cross-sectional area in VDE 0100 or in equivalent national standards. We would remind you that power converters may have a current-limiting effect.

III 2-12

### 2.4 Power losses

DCS 500 valid for DCS 500B / DCS 600 / DCF 500B / DCF 600

## DCS 500

The units' power loss is made up of several different components:

- current-dependent losses $\mathrm{P}_{\mathrm{V} \text {-I }}$
- of the thyristors
- of the fuses
- of the busbar system
- voltage-dependent losses $\mathrm{P}_{\mathrm{v}-\mathrm{u}}$
- snubber circuit of the thyristors (worst case)
- thyristors at di/dt < $20 \mathrm{~A} / \mu \mathrm{s}$
- almost constant losses $\mathrm{P}_{\mathrm{V}-\mathrm{C}}$
- unit electronics
- unit fan
- field supply

Depending on what you want to achieve by your power-loss study, you must make up your mind on the following points:

- Efficiency calculation for the drive system concerned:

For this purpose, all the power-loss components mentioned above (and additionally the losses caused, for instance, by the motor fan, line reactor, cabling of network/power converter/motor, field supply unit and matching transformer, etc.) must be added.

- Fan losses can be estimated by $95 \%$ of the fan power consumption (see table 2.5/2).

| Converter type $\rightarrow$ |  |  | $y=4$ | (1) V) | $\mathrm{y}=5$ | ( 00 V) | $\mathrm{y}=6$ | V) | $\mathrm{y}=7$ | (690 V) | $y=8$ | (790 V) | $y=9$ | 000V) |

Table 2.4/1: DCS 500 Power losses
Remarks on the table

- The values stated are "worst case", i.e. the values obtained under the most unfavourable conditions.
- The losses of the unit electronics can be assumed to be $P_{\mathrm{v}-\mathrm{c}}=30 \ldots 60 \mathrm{~W}$, dependent on the loading involved (SDCS-COMx, number of binary inputs to "1-signal", pulse encoder used, etc.).
- The current-dependent losses can be converted as follows for the partial load range:

$$
P_{V-I p a r t} \approx P_{V-I} * 0.4 * \frac{x \%}{100 \%}+P_{V-I} * 0.6 *\left(\frac{x \%}{100 \%}\right)^{2}
$$

- For the units $\leq 1000 \mathrm{~A}$, the losses due to external semiconductor busbars, busbar systems/wiring are not included.

III 2－14

## Monitoring the DCS 500 power section

a. The power sections of sizes C 1 and C 2 are monitored by an electrically isolated PTC thermistor detector, which is installed on the likewise electrically isolated heat sink near the thyristors. The resistance change proportional to the temperature is acquired and evaluated in the unit's software. If the temperature rises above a certain value predefined by the unit coding involved, then first an alarm will be outputted, and - if the temperature continues to rise - an error message. This means that changes in the rated cooling conditions, such as cooling air volume and temperature, the fan itself, overload due to an excessively high load current, etc. are detected.
b. The size-A5 power section is likewise monitored by an electrically isolated PTC thermistor detector, which is installed on the non-isolated heat sink in an isolated configuration. Evaluation of the resistance and the protection effect correspond to those mentioned for point (a.) above.
c. The size A6 and A7 power section is not directly monitored by an electrically isolated PTC thermistor detector. For this size, the same thermistor detector is used as for (a.) and (b.) above, but
it is here not mounted on a heat sink but close to the fan air outlet. The detector thus measures the power section's radiated heat and any changes in the cooling air temperature and volume. Since the cooling air volume can only be detected indirectly, a differential-pressure switch has been additionally fitted at the unit's housing, always located close to the power terminals.
The resistance change proportional to the temperature is acquired and evaluated in the unit's software. If the temperature rises above the parameterized value, then first an alarm will be outputted, and - if the temperature continues to rise - an error message. The value to be set for this parameter must not be more than 10 degrees above the permissible ambient temperature.
The differential-pressure switch compares the pressure inside the unit with the normal atmospheric pressure. If the fan has been switched on and the unit door closed (and no unit casings have been removed), the pressure switch will signal "Cooling conditions ok", which means the drive may be enabled. There is no need to set any specific differential pressure (recommendation: centre setting).

## 3 Control boards

### 3.1 Control Board SDCS-CON-2

The control board is based on the 80186EM microprocessor and the ASIC circuit DC94L01.

Con2_1_c.dsf
Fig. 3.1/1 Layout of the control board SDCS-CON-2

## Memory circuits and the back-up

The program including system and parameter values is stored at Flash PROM D33. Different programs can be downloaded directly to these PROMs. Application functionality and parameter values are saved in the Flash PROM D35.
Fault and Alarm messages -the time of their appearance and some other values like the operating hours and so on- are stored in static RAM circuits. They have a back up capacitor of 1 F , which lasts minimum 8 hours, typically several days. It takes about 30 minutes to charge the backup capacitor.

## ASIC function

ASIC = Application Specific Integrated Circuit Most of the measurements and control functions for the DCS500 are done in the ASIC:

- communication with control panel (RS 485)
- communication with field exciters (RS 485)
- measurement
- watchdog function
- A/D and D/A-conversion control
- thyristor firing pulse generation

## Watchdog function

The control board has an internal watchdog. The watchdog controls the running of the control board program. If the watchdog trips, it has the following effects:

- Writing to FPROM is disabled.
- Thyristor firing control is reset and disabled.

- Digital outputs are forced low.
- Programmable analogue outputs are reset to zero, OV.

## Seven segment display

A seven segment display is located on the control board and it shows the state of drive.

Fig. 3.1/2
Seven segment display of the SDCS-CON-2

## Auxiliary power distribution

The electronic power supply board SDCS-POW-1 (see separate chapter) generates different levels of voltages. Some of them are transferred via the CON-2 board directly to the boards, where they are used, others are manipulated and then transferred.

Fig. 3.1/3 Auxiliary power distribution on the board SDCS-CON-2

## Supply voltage monitoring

The control board monitors the following voltage levels:

| Supply voltage | +5 V | +15 V | -15 V | +24 V | +48 V 1 | +48 V 2 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Undervoltage tripping level | +4.55 V | +12.4 V | -12.0 V | +19 V | +38 V | +38 V |
| Test terminals X37: | B4 / B5 | B10 | B8 | B11 | B12 | ------- |

The electronic power supply system with the different voltage levels is monitored in two ways. There is a signal powerfail primary, which monitors the input power supply voltage of the POW-1 board and a signal powerfail secondary, which monitors the low voltage levels. If one voltage level drops below the
threshold a trip signal is generated.
In addition to that there is a monitoring function for the 5 V level. If +5 V drops under the tripping level, it causes a master reset by hardware. All I/O registers are forced to 0 and the firing pulses are suppressed.

## RS485 serial communication channels

The control board has two RS485 channels. The first channel is used for field exciter control of DCF 501B/ 502B, DCF 503A/504A or DCF 601/602 (terminals $\mathrm{X} 16: 1 \ldots 3$ ) and the second for the control panel (CDP) at terminals X33 or X34. The terminals X33 and X34 are wired up in parallel internally.

Fig. 3.1/4 Connection for field supply units DCF xxx to the RS485 Communication Interface of the SDCS-CON-2 board.

## DDCS Channel integrated

The control board SDCS-CON-2 has an integrated DDCS (Digital Drive Control System) channel with a transfer rate up to $4 \mathrm{Mbits} / \mathrm{s}$. This channel (V260) can be used for fieldbus modules with the DCS 500B converters or for the 12_PULE LINK with DCS 600 converters. The terminals X16:4 and 5 are provided for power supply of the modules $(+24 \mathrm{~V} / \leq 150 \mathrm{~mA})$.

Fig. 3.1/5

Connection of the DDCS channel with power supply to the control board SDCS-CON-2

Fig. 3.1/6 Terminal connection of the SDCS-CON-2 board

III 3-3

## 4 Power Supply Board

### 4.1 Power Supply Board SDCS-POW-1

The SDCS-POW-1 board is designed for DCS 500 converter modules and is mounted on the electronic support. This board is used for all types of modules independent from current or voltage range.

The SDCS-POW-1 works on a switched mode basis in fly back configuration. It generates all necessary DC voltages for the SDCS-CON-2 and all other electronic boards. The input voltage can be
selected via the switch SW1 either to 230 V AC or to 115 V AC. The following figure shows the instructions for the selection of the AC input voltage and for the selection of the encoder supply voltage.

If an SDCS-CON-2 (without I/O board SDCS-IOB-3) together with a pulse encoder is used for speed measurement, the incremental encoder supply voltage must be selected by jumpers X5, X4 and X3.

Fig. 4.1/1 Layout of the SDCS-POW-1 board

## AC Supply voltage

| Supply voltage | 115 V AC | 230 V AC |
| :--- | :---: | :---: |
| Tolerance | $-15 \% /+10 \%$ | $-15 \% /+10 \%$ |
| Frequency | $45 \mathrm{~Hz} \ldots 65 \mathrm{~Hz}$ | $45 \mathrm{~Hz} \ldots 65 \mathrm{~Hz}$ |
| Power consumption | 120 VA | 120 VA |
| Power loss | $\leq 60 \mathrm{~W}$ | $\leq 60 \mathrm{~W}$ |
| Inrush current | $20 \mathrm{~A} / 20 \mathrm{~ms}$ | $10 \mathrm{~A} / 20 \mathrm{~ms}$ |
| Mains buffering | $\min 30 \mathrm{~ms}$ | $\min 30 \mathrm{~ms}$ |

| Supply voltage | $+5 \mathrm{~V} *$ | +15 V | +24 V | +48 V 2 |
| :--- | :---: | :---: | :---: | :---: |
| Test terminals | X 5 B | X3 A | X3 B | heat sink T 10 |

* The 5 volt level can be checked, if 5 volt is selected!

## Backup supply

These two terminals are used to add additional capacitance (e.g. KJ 2001) to the existing ones to increase the mains buffering time. More detailed data is available on request via your ABB representative.

## Output X96-DO8

Potential isolated by relay (NO contact)
MOV- element ( 275 V )
Contact rating: AC: $\leq 250 \mathrm{~V} \sim / \leq 3 \mathrm{~A} \sim$
DC: $\leq 24 \mathrm{~V}-/ \leq 3 \mathrm{~A}$ -
or $\leq 115 / 230$ V-/ $\leq 0.3 \mathrm{~A}-$ )

## 5 Power interface boards

### 5.1 Power Interface Board SDCS-PIN-1x

The power interface board is used for converter modules model C1. There are 2 different versions in use. The used types are:

- SDCS-PIN-11 for $\mathbf{2 5}$ A, 50 A and 75 A converters at 500 V
- SDCS PIN-12 for 50 A converters at $\mathbf{6 0 0} \mathrm{V}$

The SDCS-PIN-1x boards consists of:

- firing pulse circuits and pulse transformers
- measurement of the armature current via current transformers
- snubber circuit for thyristors protection (consists of RC circuits and MOV elements)
- AC and DC high ohmic voltage measurement
- heat sink temperature measurement via PTC sensor
- scaling for rated current, zero current detection and HW type coding
- If the SDCS-PIN-11 connection board is installed in a DCF50x-0025... 0075 / DCF60x-0025...0075, then the resistors R113, R116 and R119 are not build-in

## Note:

If this PCB is used as a spare part for a DCF...., then the resistors R113/R116/R119 (value $=0 \Omega$ ) must be removed.

Fig. 5.1/1
Layout of the SDCS-PIN-1x board.

| Board type |  | PIN 11 |  |  | PIN 12 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Current transformer ratio |  | 1500:1 |  |  | 1500:1 |
| Max. rated voltage [V] |  | 500 | 500 | 500 | 600 |
| Rated current [ A ] |  | 25 | 50 | 75 | 50 |
| W10 | $2 \mathrm{Q}=\mathrm{X}$; 4Q= | $\leftarrow$ | $\leftarrow$ | $\leftarrow$ | $\leftarrow$ |

| W18 | rated current scaling | X | X | $\bigcirc$ | - |
| W80 | HW type coding | X | X | $\bigcirc$ | X |
| W81 | HW type coding | X | $\bigcirc$ | X | $\bigcirc$ |
| W82 | HW type coding | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |

Board used as a spare part:

- default: all jumpers W10-W82 are in $\bigcirc$ condition ensure the correct converter type related settings
- $\neq$ indicates a removed jumper

[^0]
### 5.2 Power interface board SDCS-PIN-20x/SDCS-PIN-20xB

The power interface board is used for DCS converter modules construction type C1 and C2. There are different versions in use. The used types are:

- SDCS-PIN-205B for 100 A... 1000 A Conv. at 500 V including the 3 -phase field supply converters DCF...
- SDCS-PIN-206B for 110 A... 450 A Conv. at 600 V

The SDCS-PIN20xB can replace the SDCS-PIN20x and PIN-20xA but not vice versa.

The SDCS-PIN-20x board consists of:

- firing pulse circuits with pulse transformers
- measurement of the armature current
- snubber circuit for thyristor protection (consists of RC circuits in parallel of the thyristors and RCD network)
- AC and DC high ohmic voltage measurement
- rated current scaling with burden resistors, zero current detection and HW voltage type coding
- interface for heat sink temperature measurement with a PTC sensor
- fuses for overvoltage protection and voltage measuring
- the same board will be used without any modification at a converter used for three-phase field supply

## Spare part

The protection of the power part is done by using RC circuits. Snubber circuits are wired in parallel to each thyristor with fuses in between. RCD elements are protected by the fuses F 101 to F 103. The AC voltage measurement is taken from behind the fuse.

## Fuse data: Bussmann KTK-R-6A (600V)

The power interface board SDCS-PIN205 can be used as a replacement of SDCS-PIN-21, 22 and 25. The board SDCS-PIN-206 can be used as a replacement of SDCS-PIN-23 and 24, but not viceversa! In case of a converter with $450 \mathrm{~A} / 520 \mathrm{~A} /$ 700 A at 500 V or a converter of 450 A at 600 V additional actions have to be taken into account.

## Note

If this PCB is used as a spare part for a DCF..., no modifications are necessary!

### 5.3 Galvanic isolation-T90, A92

The Galvanic isolation is an option for converters in the current range 2050...5150 A and rated voltages $\leq 1000 \mathrm{~V}$. For converters with a rated voltage of 1190 V and 12 -pulse serial $>2 \times 500 \mathrm{~V}$ the galvanic isolation is a standard equipment. It is used to replace the high-ohmic resistance voltage measurement and gives the advantage of a total isolation from power part to electronic part.

The transformer T90 and the DC transducer A92 are located outside the converter module. The internal $A C$ and $D C$ voltage measurement channels are opened and connected to the T90 and A92 units.

Hard and software settings:

| Voltage coding on measuring board |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Remark

The terminals on the primary side of the transformer are in special design (lug terminals).
Handling hints: First turn the screw coun-ter-clockwise to the end stop, then swing out the shrowding cover. Put in the cable lug, swing in the shrowding cover and fasten the connection by turning the screw clockwise.

### 5.4 Power Interface SDCS-PIN 41/SDCS-PIN-48/SDCS-PIN-5x

The Power Interface of DCS converter modules model A5/A6/A7 and C4 from 900 A up to 5200 A consists of two boards - the Measuring board SDCS-PIN-51 and the Pulse transformer board SCDS-PIN-41.
The following figures show the different connections between the SDCS-PIN-41 and SDCS-PIN-51 board depending on the application 2 - or 4-quadrant and the construction type.

Converters, delivered from 1998 on, will be equipped with SDCS-PIN-41A, which is a full replacement for converters, already in use.

Converters delivered from middle 2005 will be equipped with SDCS-PIN-48, which is a full replacement for converters already in use.

Fig. 5.4/1 2-Quadrant application, no parallel thyristors - Construction type A5/A6/A7 (C4)

Fig. 5.4/2 4-Quadrant application, no parallel thyristors - Construction type A5/A6/A7

Fig. 5.4/3 4-Quadrant application, no parallel thyristors - Construction type C4

The board consists of six pulse transformers with amplifiers.

Fig. 5.4/4 Layout of the SDCS-PIN-41/PIN-41A/PIN-48 pulse transformer board

## Measuring board SDCS-PIN-51

This board is always used together with SDCS-PIN-41 board. On this board there are the circuits located needed for current, voltage and temperature measuring and for hardware coding.
The current is measured by current transformers at the main AC inputs, rectified by a diode bridge and scaled with burden resistors to 1.5 V as rated current. The nominal current is adjusted by cutting out resistors (R1 ... R21) from the board according to the current coding table. The resistors R22 ... R26 are used for the current equal to zero detection. These resistors must be cut off too, according to the current coding table.

Voltages (U1, V1, W1 and C1(+) and D1(-)) are measured by using high ohm resistor chains. Scaling of AC and DC voltage is done by activating
$1 \mathrm{M} \Omega$ resistors (= cutting out short circuit wires, which are represented by low ohmic resistors). The voltage measurement uses 5 resistor:

| U1: | W1 to W5 |
| :--- | :--- |
| V1: | W6 to W11 |
| W1: | W12 to W16 |
| C1(+): | W17 to W21 |
| D1(-): | W22 to W26 |

If there is a need for voltage adaptation, all 5 chains must be handled in the same way.
Note! Actual voltage signals U1, V1, W1, C1 (+) and D1(-) of the main circuit are not galvanically isolated from the control board. Because of that a current of less than 1 mA will flow to earth.

When galvanically isolated measurement is needed, please contact your ABB representative.

Fig. 5.4/5
Layout of the SDCS-PIN-51 board

In the past some converters for line voltages lower/equal 500 V had been equipped with SDCS-PIN-52 boards. The SDCS-PIN-51 board serves as a spare part for those converters.

Figure 5.4/6 Layout of the SDCS-PIN-52

### 5.5 Zero current detection SDCS-CZD-01A

This board is used for fast zero current detection especially for three phase field converter in Motor Generator application. The board provides a safe zero current detection also for other very high inductive loads.

The board is located on SDCS-CON-2 board and plugged on X12, X13 and X17. X 17 : is only used for mechanical reasons. The electrical function (connection to IOE-1) is unchanged.

All DCS/DCF converter are equipped with a zero current detection by monitoring the current signal to a certain level.

The CZD-01A board has in addition a cathode / anode voltage measurement of all thyristors. The voltage measurement provides a sharp detection of DC load condition.

Basically two conditions need to be fulfilled to get a signal current equal to zero:

- the current detection has to indicate current equal to zero AND
- the voltage detection has to indicate current equal to zero

The activation of the board must be set in the software via parameter:
$\xrightarrow{\begin{array}{l}\text { DCF500B } \\ \text { DCF600 }\end{array}} \begin{array}{r}4.19 \text { ZERO CUR DETECT } \\ 43.14 \text { ZERO CUR DETECT }\end{array}$

With jumper J1 (not available with SDCS-CZD-01) the voltage detection can be set to two modes: with J1 in position 1-2: all thyristors (V11/V13/V15) AND all thyristors (V12/V14/V16) must have blocking voltage with J1 in position 2-3 (parking; default) all thyristors (V11/V13/V15) OR all thyristors (V12/V14/V16) must have blocking voltage

Fig. 5.5/1 Layout of the SDCS-CZD-01A board

Fig. 5.5/2 Connection between the SDCS-CZD-01A and SDCS-CON-2 board

Fig. 5.5/3 Principle diagram of SDCSCZD-01A

The power signal measurement board SDCS-MP-1 is intended to be used as a service and rebuild (DCR 500 /DCR 600 commissioning) aid. Without this board it is practically impossible to measure with oscilloscope or with general purpose meter signals between the control board and the power interface board(s).

The board is plugged to the control board connectors X12, X13 and X17. The ribbon cables normally connected to the control board are connected to the measurement board connectors having the same name as the respective connector on the control board.
Measurement points for following signals are provided:

- the three phase to ground voltages $\mathrm{U}_{\mathrm{U}}, \mathrm{U}_{\mathrm{v}}, \mathrm{U}_{\mathrm{w}}$
- the three phase to phase voltages $\mathrm{U}_{\mathrm{vu}}, \cup_{\mathrm{wv}}, \cup_{\mathrm{Uw}}$
- one rectified and filtered phase to phase voltage $U_{A C}$
- armature voltage $U_{D C}$ with sign filtered
- armature current $I_{A C T}$ with sign
- the six thyristor firing commands BZP1...BZP6
- the two current direction commands SR1 and SR2 (measurement points SR11 and SR21)
- the sum of pulse transformer primary currents can be measured across measurement points SR11-SR12 or SR21-SR22 depending on current direction
- the control board ground 0 V .

The measurement points are separated from the control board signals either with $10 \mathrm{k} \Omega$ resistors or with operational amplifiers so that accidental short circuits between the measurement points do not affect the converter operation. Measurement point 0 V is directly connected to control board ground.

Fig. 5.6/1 Layout of the SDCS-MP-1 board

Fig. 5.6/2 Connection between the SDCS-MP-1 and SDCS-CON-2 board

## 6 Digital and analogue I/O boards

The converter with a control board SDCS-CON-2 can be connected in 4 different ways to a control unit via analogue/digital links. Only one of the four choices can be used at the same time (Description

Fig. 6/1 I/O via SDCS-CON-2

Fig. 6/3 I/O via SDCS-CON-2 and SDCS-IOB-3
of the I/O's see chapter SDCS-CON-2). These possibilities doesn't increase the number of inputs or outputs. In addition to this an extension of I/O's by SDCS-IOE-1 is possible, which increases the number of inputs.

Fig. 6/2 I/O via SDCS-CON-2 and SDCS-IOB-2

Fig. 6/4 I/O via SDCS-IOB-2 and SDCS-IOB-3

### 6.1 Digital I/O board SDCS-IOB-2

As described at the beginning of the chapter, there are various options for configuring the inputs/outputs.

The board IOB- $2 x$ has 8 digital inputs and 8 digital outputs.
There are three different types existing, which differ at the input voltage level:

```
SDCS-IOB-21
SDCS-IOB-22
SDCS-IOB-23
24...48V DC
SDCS-IOB-22
115 V AC
SDCS-IOB-23
230 V AC
```

The inputs are filtered and galvanically isolated by using optocouplers. Inputs can form two galvanically separated groups by using either $\mathrm{X} 7: 1$ or $\mathrm{X7}: 2$.

If these boards are in use, they have to be mounted outside the DCS module. They must be mounted in a way, that the conductive supports have a good connection to ground of the installation.

Fig. 6.1/1 I/O via SDCS-IOB-2x / IOB-3 and CON-2

The cable length between X1:/X1: and X2:/X2: is max. 1.7 m and between $\mathrm{X} 1: / \mathrm{X} 3$ : is max. 0.5 m because of EMC reasons.

iob2x1_c.dsf

Fig. 6.1/2 Layout and jumper settings of the SDCS-IOB-2x board

III 6-2

Fig. 6.1/3

### 6.2 Analogue I/O board SDCS-IOB-3

As described at the beginning of the chapter, there are various options for configuring the inputs/outputs.

The board SDCS-IOB-3 consists of the 5 analogue inputs, 3 analogue outputs, the galvanical isolated pulse encoder interface and a current source for temperature measuring devices.

If these boards are in use, they have to be mounted outside the DCS module. They must be mounted in a way, that the conductive supports have a good connection to ground of the installation.
The cable length between X1:/X1: and X2:/X2: is max. 1.7 m and between $\mathrm{X} 1: / \mathrm{X} 3$ : is max. 0.5 m because of EMC reasons.

(5) designated for PT100 evaluation per software and hardware
(6) If the input is used for tacho feedback and the tacho voltage needs to be scaled, the board PS5311 must be ordered separate. If this input is used for feedback signals, there is a need for additional margin for overshoot measurement. This margin is set by software and results e.g. in the 8 to 33 volts at PS5311. short circuit proof

Note:
When the SDCS-CON-2 control board with the SDCS-IOB-3 I/O board is installed, the connection via plugs S4:1-2 and 3-4 on the SDCS-CON-2 must be treated according to the diagram below:

Terminals X3:, X4: and X5: on the SDCS-CON-2 must not be used.

|  |  |  |  |  |  |

| Encoder supply |  | Remarks |
| :--- | :--- | :--- |
|  |  | Inputs isolated; <br> Impedance $=120 \Omega$, if selected <br> max. frequency $\leq 300 \mathrm{kHz}$ |
|  |  | Sense lines for GND and supply to correct volt- <br> age drops on cable (only if 5V/12V enc. is in use) |
| $5 \mathrm{~V} /$ | $\leq 0.25 \mathrm{~A}$ * |  |
| $12 \mathrm{~V} / 24 \mathrm{~V}$ | Incremental encoder power supply |  |

(7) Residual current detection is selected as default. The jumpers $\mathrm{S} 1: 11-12$ and S1:13-14 are set, inputs X3:9 and X3:10 and jumper S1:9-10 must not be used and inputs $\mathrm{X} 3: 11$ and $\mathrm{X} 3: 12$ serve as input for the current signal taken from a current transformer. This detection is based on a sum current transformer where the secondary is connected through a diode bridge to $100 \Omega$ resistor . Voltage will appear across the resistor, if the sum of the 3 -phase current is not zero. In case Al4 should be used for a different purpose, use the inputs/jumpers accordingly and take the block diagram as a help.

## Restrictions using jumper S1, S2 or S3:

The selection for the burden resistor across the input terminals can be done independent from S2 or S3 settings for inputs AITAC, Al1, AI2, AI3 and AI4.
If the gain is set to 10 by using S 2 or S 3 and the $500 \Omega$ burden resistor is activated, the input signal level is changed to $-2 \mathrm{~mA} \ldots . . \ldots+2 \mathrm{~mA}$.
For input Al4 there are the following configurations available:

- input range " $20 \mathrm{~mA}^{\text {" , or }}$
- input range " 10 V ", or
- earth fault monitoring by Isum not equal to zero via X3:11 and X3:12

## Connecting a pulse encoder to the DCS 500B / DCS 600 converter

The connection diagram for a pulse encoder to the electronics of a DCS converter is quite similar, if the SDCS-CON-2 or the SDCS-IOB-3 is used. The basic difference between these 2 boards is the galvanical isolated circuit on the SDCS-IOB-3 board.

## Power supply for incremental encoder

There is a galvanically isolated power supply for the incremental encoder on SDCS-IOB-3. The jumper S4 on this board is used to select either $+5 \mathrm{~V},+12 \mathrm{~V}$ or +24 V as a supply voltage for the pulse encoder. When LED indicator (V17) is lit, the supply is OK.
The pulses generated by the pulse encoder are transferred to the pulse receivers via opto couplers.

Fig. 6.2/4 Connections incremental encoder - electronics

If the SDCS-CON-2 board is used the supply voltage for the pulse encoder is selected on the SDCS-POW-1 board (refer to SDCS-POW-1).

In both cases the voltage regulator has a feedback control with Sense power and Sense GND signals.

Feedback connection is recommended when power supply level for differential pulse encoder is 5 V . If a 12 V pulse encoder type is in use the sense function is also available. The wiring is shown on figure 6.2/4.

## Note:

If the drive's direction of rotation is correct (if necessary, correct by exchanging the field connections), the Tacho error message may appear during start-up.

If with a positive reference the TACHO_PULSES signal (with software 21.xxx: parameter 12104) does not look like the illustration below, then tracks A and $\overline{\mathrm{A}}$ must be mutually exchanged with encoders with inverted signals, and tracks $A$ and $B$ with encoders without inverted signals.

If the TACHO_PULSES signal is missing or non-linear, the encoder's pulses are not being read correctly. Possible reasons for this may be the encoder supply, the encoder itself, or the wiring.

Fig. 6.2/5 TACHO_PULSES signal

## Incremental encoder

Two different incremental encoder connections are available.

- differential connection; pulse encoders generating either voltage or current signals can be used
- single-ended (push pull) connection; voltage signals

## Restrictions using jumper S1: or S10: depending on the board

Line termination via S1/S10: 2-3 / 8-9 / 14-15 should not be used at 12 V or 24 V encoders, because of the power consumption taken from the encoder. If a pulse encoder with a build in current source is used a burden resistor of $120 \Omega$ is activated via jumper S1/ S10: 1-2 a.s.o.

Fig. 6.2/6 Pulse encoder connection principles

If a single ended $12 \mathrm{~V} / 24 \mathrm{~V}$ encoder is used $\mathrm{S} 1 / \mathrm{S} 10$ should be set to 5-6 / 11-12 / 17-18 according to the layouts of the boards. This setting results in an internal threshold of appr. 5 V .

In case of a single ended 5 V encoder the jumpers will be setto a neutral position S1/S10: 4-5/10-11/16-17. To get a threshold lower than 5 V each terminal X5:2 / X5:4 / $\mathrm{X} 5: 6$ must be connected via a resistor $\mathbf{R}$ to GND according to the table below.

| $\mathbf{R}$ | $1 \mathrm{k} \Omega$ | $1.5 \Omega$ | $2.2 \mathrm{k} \Omega$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{U}_{\text {thresh }}$ | 1.2 V | 1.8 V | 2.3 V |

Make sure the threshold is half of the supply voltage and the minimum voltage of the encoder output (saturation voltage $U_{C E}$ of a transistor).

Three differential inputs are reserved for connecting the pulse encoder. CH A and CH B are the normal pulse channels having nominal $90^{\circ}$ phase shift between the channels.

The channel CH A- (CH B-) is the inversed channel CH A $(\mathrm{CH} \mathrm{B}) . \mathrm{CH} \mathrm{Z}$ is the zero pulse channel which can be additionally used if the encoder has an output giving one "zero" pulse per revolution.

The distance between pulse encoder and interface board is dependent on the voltage drop on the connecting lines and on the output and input configuration of the used components. If cables are used according to the next table the voltage drop caused by the cable can be corrected by the voltage regulator.

| Cable length | parallel wires for <br> power source \& GND | Cable used |
| ---: | :---: | :---: |
| $0 \ldots 50 \mathrm{~m}$ | $1 \times 0.25 \mathrm{~mm}^{2}$ | $12 \times 0.25 \mathrm{~mm}^{2}$ |
| $50 \ldots 100 \mathrm{~m}$ | $2 \times 0.25 \mathrm{~mm}^{2}$ | $12 \times 0.25 \mathrm{~mm}^{2}$ |
| $100 \ldots 150 \mathrm{~m}$ | $3 \times 0.25 \mathrm{~mm}^{2}$ | $14 \times 0.25 \mathrm{~mm}^{2}$ |

### 6.3 Extension board SDCS-IOE-1

## The board consists of:

7 isolated digital inputs
2 analogue inputs
1 current source for the supply of PTC or PT 100 elements
The board is connected electrically via a 10 pin flat cable to the converter module electronics. The connection will be done to the SDCS-CON-2 board from terminal row X17 to X17 on SDCS-IOE-1. It has to be mounted outside of the converter module. The cable length is 2 m because of EMC reasons.

## Mechanical Construction

The board is mounted on a plastic housing which has foot elements (Phoenix Contact series UMK). The foot elements permit snap-in assembly to a standard DIN EN rail (EN 50022, 50035).
The dimensions are including the plastic housing.

## 7 Communication boards

### 7.1 Communication board SDCS-COM-5

This board is used for communications to DCS 500B converter modules equipped with software 21.xxx for commissioning and maintenance purposes. It consists of 3 different communication channels. All RxD channels (receiver) have blue color, all TxD channels (transmitter) have grey color. If any connections should be made always connect the same color with each other (plug and socket) .
Channel 1 is a HDLC channel of 1.5 Mbits/s and is used for the communication with a PC. Channel 2
cannot be used together with software version S21.xxx.
Channel 3 is a DDCS channel of up to $4 \mathrm{Mbits} / \mathrm{s}$ and is used if a serial link based on PROFIBUS hardware, CS31 hardware or MODBUS hardware should be realized. If one of these possibilities should be used an adaptation module is needed. This channel can only be used with software version S21.1xx (SDCS_CON-1). Please refer to the documentation which is available for the link system needed.

Fig. 7.1/1 Connection between SDCS-COM-x and a partner

Fig. 7.1/2 Layout and jumper settings of the SDCS-COM-5 board

This board must be used together with a DCS 600 module equipped with a SDCS-CON-2 board including software S15.xxx.

The board is equipped with an own controller with the following main functionalities:

- The software structure implemented in this board is divided in two sections. The first section is built from the speed regulator and its additional functions which is producing the torque reference.
- The second section is prepared to be programmed with its own characteristics for control and regulation.
- Evaluation of the received data to produce a torque reference to be transmitted to the controller board CON-2. Actual values from the CON-2
are read, evaluated and retransmitted to the overriding control.

Furthermore the board is equipped with three optical channels (max. data transmission speed is 4 Mb for each optical channel):

- Channel 0 is used to communicate data from the overriding control (FCI, APC2, AC80, Nxxx-xx (adapter modules for fieldbus), AC800M) or via adapter modules from other controllers) to the DCS600-drive.
- Channel 2 (Master-Follower) is used to operate two or more drives dependent on each other. Commands and values needed for this application are produced on this board.
- Channel 3 is prepared to connect the PC tool for commissioning and maintenance (DriveWindow).

Fig. 7.2/1 Layout of the SDCS-AMC-DC / SDCS-AMC-DC Classic board / AMC-DC Drive Bus

The SDCS-AMC-DC and the SDCS-AMC-DC Classic boards are identical except the assembly of optical components for channel 0 and 2 .

|  | optical Components |  | Channel 0 used for | D400 | driver current | Communication ** |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 7.3 DDCS Branching unit NDBU-95

DDCS Branching Unit (DBU) is used (only for DCS 600/DCF 600) to implement the star topology of DDCS link. This allows a slave unit to fail or become unpowered without disabling the communication. The NDBU receives messages from the master (PC) and sends them to all the slave units simultaneously. Each slave unit has an individual address and only the addressed slave unit sends a reply message to the master. It is also possible to use NDBU thus enabling peer-to-peer communication.

## Technical specifications

| Optical links: |  |
| :---: | :---: |
| Master channels | 1 DDCS input and 1 DDCS output |
| Slave channels | 9 DDCS inputs and 9 DDCS outputs |
| Data rate | 1-4 MBd, programmable |
| Driving current | $20 \mathrm{~mA}, 30 \mathrm{~mA}, 50 \mathrm{~mA}$ + channel disabling, programmable |
| Monitoring | a green LED for each channel, switched on when NDBU is receiving messages |
| Transmission device | 10 Mb component for each channel |
| Power supply: |  |
| Input voltage | +24 VDC $\pm 10 \%$ |
| Input current | 300 mA |
| Monitoring | a green LED switched on when the output voltage is normal |
| Operating temperature: $+0 \ldots+50^{\circ} \mathrm{C}$ |  |
| PCB dimensions: | s. diagram beside |

Remark: Only channels with the same components (e.g. 10 Mb component) may be connected to each other.

For further information see Appendix $D$ in the DriveWindow User's Manual.

## Note

For addressing and automatic node numbering of the drives and branching units see DriveWindow documentaion.

NDBU-95 DDCS Branching Unit has nine output channels where messages from the master are sent. The reply message sent by one slave unit is delivered to the master and it can be delivered also to other slaves if necessary. Several NDBU-95s can be used in parallel, in series or in any combination of these. The maximum distance between the master and NDBU-95 as well as between two NDBU-95s, see manual 3ADW000100R0201.

Fig. 7.3/1

## 8 Field exciters

The DCS 500 system has different options for the field supply. There are one and three phase field exciters available, which can be either integrated (diode field exciter SDCS-FEX-1 and half controlled field exciter SDCS-FEX-2A) or externally mounted (half controlled DCF503-0050 with the SDCS-FEX32 board and fully controlled DCF504-0050 with the SDCS-FEX-31 board).

Three phase field exciters DCF 50xB/60x are converter modules themselves, similar to the DCS $501 \mathrm{~B} / 601$ or DCS 502B/602 additionally a overvoltage protection unit is needed see chapter 8.4.

### 8.1 SDCS-FEX-1 (internal)

The Diode Field Exciter board SDCS-FEX-1 is a single phase diode rectifier for an AC input voltage up to 500 V and a DC output current of 6 A . The board has to be mounted inside the armature converter module. The excitation current is defined by the DC output voltage (line voltage multiplied by 0.9 ) and the resistance of the field winding. By using an external resistor in series with the field winding the field current can be adapted slightly. If the SDCS-FEX-1 board isn't already installed it must be mechanically fixed beside the electronic power part SDCS-POW-1 and connected via a flat cable to the SDCS-CON-2 by using terminal X14.

Fig. 8.1/1 Layout of the SDCS-FEX-1 field exciter board

Fig. 8.1/2 Diode field exciter with field loss monitoring

### 8.1.1 Electrical data of FEX-1

| AC input voltage: | $110 \mathrm{~V} \mathrm{-15} \mathrm{\%} \ldots .500 \mathrm{~V}+10 \%$ |
| :--- | :--- |
| max. DC output current: | $6 \mathrm{~A} ; \mathrm{I}_{\mathrm{F} \text { rated }}$ |
| DC output curr. monitoring: | $20 \mathrm{~mA} \ldots . .6 \mathrm{~A}$ |
| Power loss at $\mathrm{I}_{\mathrm{F} \text { rated }}:$ | $\leq 10 \mathrm{~W}$ |
| AC Isolating voltage: | 600 V |
| Terminals X1: <br> Cross sectional area | $2,5 \mathrm{~mm}^{2}$ |

The AC share of the output DC voltage is measured with a capacitor and an auxiliary rectifier and used for current monitoring.
Transistor relay is closed when the DC current is flowing (>0.02 A).

Fig. 8.1/3
Output voltage with inductive or resistive load - High-signal at X14:B3

Output voltage without load
Low-signal at X14:B3

The field exciter board SDCS-FEX-2 / FEX-2A consists of a power part and a control board, which connects all components electrically and mechanically to each other. This arrangement has to be mounted inside the armature converter module beside the electronic power supply SDCS-POW-1. This is intended to be done for DCS modules of type C1, C2 and A5, not for A6 and A7 (C4)!

The power part is build up with two power modules. Each of the modules consists of one diode and one thyristor, so they are wired up and controlled like a half controlled bridge.

The control is based on a fully digital system. The $\mu$-processor reads all information from the power part, is supplied with all needed voltage levels and control signals via the flat cable X14 by the SDCS-CON-2 and generates the firing pulses for the power part.

The range of the single phase rated $A C$ input voltage is 110 V to 500 V , the maximum current capability is 16 A . If this field exciter is used for smaller field current, the control unit automatically selects a lower current range between 3 A to 16 A to get the best resolution.

Fig. 8.2/1 Layout of the SDCS-FEX-2A field exciter board

### 8.2.1 Electrical data of SDCS-FEX-2 / FEX-2A

| AC input voltage: | $110 \mathrm{~V}-15 \% . .500 \mathrm{~V}+10 \%$; single phase |
| :---: | :---: |
| AC input current: | $\leq$ output current |
| AC isolation voltage: | 600 V |
| Frequency: | same as DCS converter module |
| DC output current: (1) | 0.3 A A.. 8 A for armature converter module from 25 A to 75 A 0.3 A... 16 A for armature converter mod. from 100 A to 2000 A |
| Power loss at $\mathrm{I}_{\text {F rated }}$ : | $\leq 40 \mathrm{~W}$ |
| Output IACT: | $\mathrm{U}_{\text {out }}=4 \mathrm{~V}^{*} \mathrm{I}_{\text {act }} / \mathrm{I}_{\text {lim }} ; \mathrm{I}_{\text {lim }}=3 \mathrm{~A}, 5 \mathrm{~A}, 7 \mathrm{~A}, 9 \mathrm{~A}, 11 \mathrm{~A}, 13 \mathrm{~A}, 15 \mathrm{~A}, 17 \mathrm{~A}$ |
| Terminal X1: <br> Cross sectional area | $4 \mathrm{~mm}^{2}$ |

(1) If Field weakening is needed, actual field current of the motor at top speed must be higher than 0.3 A

### 8.2.2 Control unit

The control unit includes the following main blocks:

- Micro controller 80C198 for controlling and firing
- Actual DC current measurement with an AC current transformer.
- RS485 interface to the converter's controller board SDCS-CON-x.

The software for the field current control is stored in the ROM memory of the 80C198. The control is done by using a PI structure for the current controller. All parameters needed for the control or for scaling reasons (selection of burden resistors) are stored in the non-volatile memory of the armature converter and transferred to the field controller during each initializing process via the RS485 link. The Node number is always fix coded to Node number $=1$.

The output lact represents the actual field current, which is measured via the AC transformer, then rectified and transferred into a voltage signal with burden resistors. The burden resistors, as mentioned before, are adapted by the board itself depending on the setting of the nominal field current of the motor (see list before). The resulting burden voltage can be measured at test terminals beside X14:. The $2.2 \mathrm{~K} \Omega$ resistor allows a short circuit at the terminals; the external measuring device should have an internal resistance higher than $1 \mathrm{M} \Omega$.

### 8.2.3 Power section

Two diode-thyristor modules are arranged as a half-controlled single-phase rectifier. The anodes of the two diodes are not connected directly to each other as usual; they are now connected to the ends of the four turn primary winding of the current transformer. The center tap is the negative output of the rectifier. Thus it is possible to measure the DC current with an AC current transformer.

A MOV (Metal Oxide Varistor) protects the AC input against voltage spikes from the external source. Another MOV protects the DC output against voltage surges which can be caused by the field winding of a DC machine.

The terminal row X20: is used for test purposes.

Fig. 8.2/2 Block diagram of the field exciter SDCS-FEX-2A

### 8.3 DCF503A-0050 and DCF504A-0050 (external)

The half controlled (2-Q) field exciter unit DCF503A0050 consists of the SDCS-FEX-32A board, two thyristor/diode power modules and auxiliaries (power supply, line choke). The full controlled (4-Q) field exciter unit DCF504A-0050 consists of the SDCS-FEX-31A board, four anti-parallel thyristor/ thyristor
power modules and the same auxiliaries.
The control is structured similar to the SDCS-FEX-2A field supply. A micro controller is used for controlling and firing. The DC current is measured by using an AC current transformer (same configuration than at SDCS-FEX-2A).

Fig. 8.3/1 Different versions of power section of the DCF50xA-0050

Fig. 8.3/2 Layout of the DCF504A-0050 field exciter unit

### 8.3.1 Electrical data of DCF50xA-0050

| Power part AC input voltage: | $110 \mathrm{~V}-15 \%$.. $500 \mathrm{~V}+10 \%$; single phase |
| :---: | :---: |
| AC input current: | s output current |
| Frequency: | same as DCS converter module |
| AC isolation voltage: | 690 V |
| Line reactor: | $160 \mu \mathrm{H} ; 45-65 \mathrm{~Hz}$ |
| DC output current: (1) | 0.3..50 A |
| Power loss at $\mathrm{I}_{\mathrm{Frated}}$ : | $\leq 180 \mathrm{~W}$ |
| Load condition | always L/R > 100 ms (saturation) |
| Auxiliary voltage (X3:1-2) |  |
| AC input voltage: | $110 \mathrm{~V}-15 \%$... $230 \mathrm{~V}+10 \%$; single phase |
| Frequency: | $45 \ldots 65 \mathrm{~Hz}$ |
| AC input power: | $15 \mathrm{~W} ; 30 \mathrm{VA}$ |
| Inrush current: | $<5 \mathrm{~A} / 20 \mathrm{~ms}$ |
| Mains buffering: | min 30 ms |
| Terminal row X2: |  |
| X2: 1 RS 485 | serial link to X16: 1 at SDCS-CON-1/ CON-2 |

| X2: 3 Ground B | grounded via cable screen and / or grounded via S2 |
| X2: 4 | not used |
| X2: 5 | not used |

(1) If Field weakening is needed, actual field current of the motor at top speed must be higher than 0.3 A

III 8-4

### 8.3.2 Electronic power supply

There is a power supply unit on the board. Supply is connected at terminal X 3 . The rated AC voltages 115 V and 230 V can be applied without any modification.
The power supply unit provides the DC voltages 30 $\mathrm{V}, 15 \mathrm{~V}, 5 \mathrm{~V}$ and -15 V to the control electronics. Voltages can be measured by means of a multimeter from the terminal X70 (see the layout). In addition the power supply generates 5 V for galvanic isolated RS485 communication drivers. This voltages can be measured at terminals X100/X101.

| Measured <br> voltage | Terminal <br> positive | Ground |
| :---: | :---: | ---: |
| +5 V | X70:1 | X70:2 (GND) |
| +30 V | X70:3 | X70:5 (GND) |
| +15 V | X70:4 | X70:5 (GND) |
| -15 V | X70:6 | X70:5 (GND) |
| +5 V | X100 | X101:1 (GNDB) |

### 8.3.3 Control unit

The control unit includes the following main blocks:

- Micro controller H8 for control and firing
- Actual DC current measurement with an AC current transformer.
- RS485 interface to the converter's controller board SDCS-CON-x.

The software for the field current control is stored in the FlashPROM memory. This software contains a

PI current controller
Fault/reset logic
Synchronization and PLL function
Bridge reversal function (only DCF 504A)
The setting and updating of all control parameters are set from armature converter via RS485 interface. Actual current, field current reference, control and status bit are cyclic sent via RS 485 communication.

The field exciter is equipped with an auto-scaling function of burden resistor based on the nominal field current of the motor.

The output $I_{\text {act }}$ represents the actual field current, which is measured via the AC transformer, then rectified and transferred into a voltage signal with burden resistors. The burden resistors -scaled to measurement range- are adapted by the board itself depending on the setting of the nominal motor field current. The current signal can be measured $\mathrm{U}_{\text {Cursig }}$ at $\mathrm{X} 20: 3-\mathrm{X} 70: 2$ and is scaled to

$$
\begin{gathered}
4 \mathrm{~V} \mathrm{I}_{\text {act }} / \mathrm{I}_{\text {scale }} \\
\mathrm{I}_{\text {scale }}=3 \mathrm{~A}, 5 \mathrm{~A}, 7 \mathrm{~A}, 9 \mathrm{~A}, 11 \mathrm{~A}, 13 \mathrm{~A}, 15 \mathrm{~A}, 17 \mathrm{~A}, 21 \mathrm{~A}, \\
27 \mathrm{~A}, 33 \mathrm{~A}, 39 \mathrm{~A}, 45 \mathrm{~A}, 51 \mathrm{~A}
\end{gathered}
$$

### 8.3.4 Power section

If a DCF503A-0050 is in use two diode-thyristor modules are arranged as a half-controlled singlephase rectifier. If a DCS504A-0050 is in use four thyristor-thyristor modules are arranged as a fullcontrolled single-phase rectifier. The anodes of the two diodes (anodes / cathodes of the thyristors) are not connected directly to each other as usual; they are connected to the ends of the primary winding of the current transformer. The centre tap is the negative output of the rectifier. Thus it is possible to measure the DC current with an AC current transformer.

A MOV (Metal Oxide Varistor) protects the AC input against voltage spikes from the external source. Another MOV protects the DC output against voltage surges which can be caused by the field winding of a DC machine. The free wheeling function needed e.g. during network failure is "build in" because of the diodes, if the half-controlled version is in use. If the full-controlled version is used the free wheeling function is realized by using the thyristors in diode mode, triggered by a fast voltage rise.

### 8.3.5 RS232-Port

The RS232 interface is used for download the 'Field exciter firmware package'.

The default settings of this interface are as follows:

| Signal level: | RS232 (+12V /-12V) |
| :--- | :--- |
| Data format: | UART |
| Message format: | Modbus-Protocol |
| Transmission method: | half-duplex |
| Baudrate: | 9.600 Baud |
| Number of Data bits: | 8 |
| Number of Stop bits: | 1 |
| Parity-Bit: | odd |

Fig. 8.3/3 Pin assignment of RS232-Port
The programming procedure is activated by setting S1:1-2 during auxiliary voltage is switched ON. Setting for field exciter mode is S1:3-4 (default).

### 8.3.6 Field exciter configurations

The data exchange between

- SDCS-CON-2 and
- field exciter SDCS-FEX-2A or
- DCF503A/504A-0050 or
- DCFx01/x02 (three-phase field exciter) is done via a RS485 serial link, which can be configured as a bus structure. This link is used to transfer references, actual values and settings for up to two field exciter units.

The drive software located on the SDCS-CON-2 board consists of two field supply functions, first field exciter and second field exciter. The first field exciter is already connected to the EMF controller to control the motor in all points of the motor diagram. The second field exciter is accessible via the field current reference.

The RS485 interface works with a screened twowire cable. The allowed length is 5 m . The wires have to be connected to the terminals $\mathrm{X} 2: 1$ and X2:2 and the screen to X2:3.

Typical application of this kind is two DC motors connected to one converter. The load sharing can be done by means of adjusting the excitation current of the second DC-motor.

There are two possible configurations for two Node numbers of the field exciters:

- one SDCS-FEX-2A and one external field exciter (DCF503A-0050, DCF504A-0050 or 3-phase field exciter) or
- two external field exciter units (DCF503A-0050, DCF504A-0050 or 3-phase field exciter).

Fig. 8.3/4 Typical application example with two field exciter units and one converter (without field weakening).

If a SDCS-FEX-2A is used, it will be always recognized as the field exciter Node 1 by the software.
Node 1 or Node 2 must be coded according to the table below for DCF503A/504A-0050 and for the 3phase field exciters (via parameter). The scan time for Node $1=10 \mathrm{~ms}$, for Node $2=100 \mathrm{~ms}$. Field weakening is not necessarily available for Node 2.

| Field exciter Node 1 |  | Field exciter Node 2 |  |
| :--- | :---: | :---: | :---: |
| Unit type | Setting X800 | Unit type | Setting X800 |
| SDCS-FEX-2A | --- | --- | --- |
| DCF 503A/504A | X800:1 = OFF | --- | -- |
| SDCS-FEX-2A | --- | DCF 503A/504A | X800:1 = ON |
| DCF 503A/504A | X800:1 = OFF | DCF 503A/504A | X800:1 = ON |

Procedure for field exciter Node changing of the
DCF 503A/504A:

- Switch off the units voltage supply
- Set the appropriate switch according to the table
- Initialization through switch on the electronics supply voltage

Fig. 8.3/5 Serial communication cable connection and address setting for Node 1 and field exciter Node 2, using SDCS-FEX-2A and DCF50xA-0050

Fig. 8.3/6 Serial communication cable connection

### 8.3.7 Diagnosis

The armature converter receives via serial link the sum of all faults in "Fex status bit". A more detailed error code is given on the seven segment display of DCF 503A/ DCF 504A.
All faults are reset with the next ON command given to the armature current controller.

| $\square$ | FAULT |
| :---: | :--- |
| $\square$ | Definition |
| 8 | Boot sequence failed or Flash PROM empty |
| F81 | Auxiliary voltage below 90 V |
| F82 | Hardware fault |
| F83 | Software fault |
| F84 | Par flash read fault <br> e.g. checksum wrong |
| F85 | Compatibility fault <br> Software or typecode not compatible to parameters |
| F86 | Typecode read fault <br> Checksum failure during typecode check |
| F88 | Mains voltage smaller 40 $\mathrm{V}_{\mathrm{AC}}$ |
| F89 | Mains voltage higher 620 $\mathrm{V}_{\mathrm{AC}}$ |
| F90 | Mains sync. fault <br> e.g. f < 40 Hz, $\mathrm{f} ~ 70 ~ \mathrm{~Hz}$ |
| F91 | Field current above 125\% of selected current measurement range |
| F92 | Fast voltage rise <br> see parameters: <br> DCS600: [P44.04 / P44.10] <br> DCS500B: [P13.10 / P13.07] |

### 8.4 DCF505 / DCF506 Overvoltage Protection

The three-phase field supply converter DCF 501B/ 502B and DCF 601/602 need a separate active Overvoltage Protection unit DCF 505 or DCF 506 to protect the power part against inadmissibly high voltages.

The protection unit activates a free-wheeling circuit between the $\mathrm{F}+$ and F - connectors if an overvoltage occurs. The DCF 505/506 consists of a trigger unit
(SDCS-FEP-x) and a free-wheeling thyristor (two in anti-parallel at DCF 506).

The DCF 506 consist of a relay output to indicate a free-wheeling condition to the field supply converter. When the free-wheeling function is triggered, it will last until the DC current is less than appr. 0.5 A. During this time the relay contacts are closed.

The overvoltage protection unit DCF 505 is suitable for 2-Q converters DCF 501B/601 with simple nonmotoric inductive load.

Fig. 8.4/1: Simple load with DCF 501B/601 and 2-Q Overvoltage Protection DCF 505

For motor field supply via DCF 501/601 (2-Q) or DCF 502B/602 (4-Q) the overvoltage protection unit DCF 506 is always required.

## Line chokes type ND 01...ND 16

Line chokes for use in industrial environment (minimum requirements), low inductive voltage drop, deep commutation notches.
Line chokes ND01...ND06 are equipped with cables. The bigger ones ND07...ND16 are equipped with busbars. When connecting them to other components, please take relevant standards into account in case the materials are different. Don't use choke terminals as cable or busbar support!

## Line chokes type ND 401...ND 413

Line chokes for use in light industrial/residential environment, high inductive voltage drop, reduced commutation notches.

These chokes are designed for drives which usually operate in speed control mode at 400 V or 500 V networks. Because of that a duty cycle has been taken into account. The percentage taken into account for that duty cycle is different for 400 V and 500 V networks:

- for $\mathrm{U}_{\text {rated supply }}=400 \mathrm{~V}$, DC curr. $1 \approx 90 \%$ of nominal current
- for $\mathrm{U}_{\text {rated supply }}=500 \mathrm{~V}, \mathrm{DC}$ curr. $1 \approx 72 \%$ of nominal current

For easier reading the maximum average DC load current is listed instead of the percentage in the next table.

Line chokes ND401...ND402 are equipped with terminals. The bigger ones ND403...ND413 are equipped with busbars. When connecting them to other components, please take relevant standards into account in case the materials are different.

### 9.3 Fan, electronics

### 9.3.1 Supply transformer T2 for electronics and fan

The supply transformer T2 has been re-designed. The new power and current rating allows to supply then 2-phase fans and the electronics by one transformer only in case A5 converters are used in a 12-pulse configuration.
They differ in their electrical data and therefore can be identified by their name plate.

Fig. 9.3/1: Dimensions Transformer T2

## Application hint:

Input voltage: 230/380... 690 V/1~; $\pm 10 \%$
Frequency: $50 . . .60 \mathrm{~Hz}$
Output voltage: 115/230 V/1~

| Type | Power <br> [VA] | Weight <br> [kg] | Fuse F2 <br> [A] | $\mathbf{I}_{\text {sec }}$ <br> [A] | Power loss <br> $[W]$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| T2 | 1400 | 15 | 16 | $6(0 \ldots . .230 \mathrm{~V})$ <br> $12(0 . .115 \mathrm{~V})$ | 100 |

Table 9.3/1: Data supply transformer T2

The transformer is designed to work as a $230 \mathrm{~V} /$ 230 V transformer to open/avoid ground loops. This is done via the 380 V and 600 V taping according to the left picture.

Transformer data T2 used in the past:

| Type | Power <br> [VA] | Weight <br> [kg] | Fuse F2 <br> [A] | Power loss <br> [W] |
| :--- | :---: | :---: | :---: | :---: |
| T2 | 460 | 13 | 6 | 20 |

Table 9.3/2: Data supply transformer T2

### 9.4.1 Residual current detection

The converters DCS500B and DCS600 together with the board SDCS-IOB-3 and a specially designed current transformer (CT), big enough to feed through all the cables / busbars of the three phases are already prepared to detect residual current. This option can only be used at grounded networks.

## Attention

This detection cannot be used to protect persons or animals against electrical shock!

Normally the current taken from the network, passing

the converter on one phase, then going to the motor will leave the converter on a different phase and ending in the network. A current sample taken from different phases always will show the same amount, but a different sign at two phases and no current at the third. With all three phases feed through one current transformer, the magnetic field around each conductor will compensate each other in case the current takes the path intended and the signal measured at the signal terminals of the current transformer will be zero.
This relationship can be described by this formula:

$$
\Sigma\left(I_{L 1}+I_{L 2}+I_{L 3}\right)=0
$$

In case the current takes any path different to the one roughly described above the current entering the converter at one phase will be different to the one leaving the converter at another phase. The magnetic field will not compensate which results in a current signal given by the CT and which is equivalent to the current missing. Any current caused for example by stray capacitance ( Cp ) is measured and may need to be treated separate. This signal is read by the circuit
on the SDCS-IOB-3 board and then calculated by the converter's firmware to be available for further use.
A drive system normally consists of several groups of consumers. As long as the supply for consumer(s) is taken from the three phases feed through the CT all these consumers are monitored. This is the way to monitor either only the motor's armature circuit, or armature and field or the complete drive with all the auxillary circuits like motor fan or other consumers.

### 9.4.2 Electrical and mechanical data

There are 2 different current transformers available. They basically differ by their physical dimensions. Consumers connected via cables will have a lower current and therefore monitored most often by the smaller CT, specified for 1500 A. Bigger consumers or even several drives monitored as a group and supplied via busbars use the bigger one, specified for currents up to around 3300 A. Finally the cross sectional area available for the conductors for the three-phases is the criteria to use the one or the other type. Furthermore, the CTs can replace each other electrically, the value for the nominal load current should be taken as a suggestion and the overall accuracy becomes better, if the current of the load is close to the current capability of the CT.

|  | PWS 10004 | PWS 33001 |
| :--- | :---: | :--- |
| Insulation voltage <br> Load current | $\leq 1000 \mathrm{~V}$ <br> $\leq 1500 \mathrm{~A}$ | $\leq 1500 \mathrm{~V}$ <br> appr. $1200 \mathrm{~A} \ldots 3300 \mathrm{~A}$ |
| Ambient temperat. | $-25^{\circ} \ldots+70^{\circ} \mathrm{C}$ |  |
| Ratio | $400: 1$ |  |

When doing the final mechanical work, please try to make sure the conductors are placed symmetrically within the available cross sectional area.

The current transformer has got no burden resistor build in. The CT output has to be connected to the SDCS-IOB-3 board via a shielded twisted pair cable maximum 2 m long. The circuit the CT's output signal is connected to, consists of a diode bridge for rectification, a burden resistor to change the signal to voltage level and some elements for protection. Finally the signal equivalent of the difference in current is read by Analog Input 4. For more details, see Software Description.

Current transformer type PWS 10004 ( $1 \leq 1500$ A)

Fig. 9.4/1: Dimensions of current transformer type PWS 10004
III 9-8

Fig. 9.4/2: Dimensions of current transformer type PWS 33001

### 9.4.3 Mechanical fixing

These current transformers don't have fixings attached to them. There are holders available for the small and the bigger one. Because of the CT's construction a left and a right one is necessary per CT.

## Current transformer type PWS 10004 (I $\leq 1500 \mathrm{~A})$

Fig. 9.4/3: Fixing of current transformer type PWS 10004

Fig. 9.4/4: Drilling pattern of current transformer type PWS 10004

Current transformer type PWS 33001 ( $1 \leq 3300 \mathrm{~A}$ )

Fig. 9.4/5: Fixing of current transformer type PWS 33001

Fig. 9.4/6: Drilling pattern of current transformer type PWS 33001

## Hints

After having all parts installed, please make sure:

- jumper S1 on SDCS-IOB-3 is in position 11-12 and 13-14
no cables connected to terminals X3:9 and X3:10 at SDCS-IOB-3 board
- select AI4 for this monitoring function by parameter activate that monitoring function via parameter define the threshold in amps via parameter if necessary delay the error message via parameter to avoid actions caused by disturbance or similar

### 9.5.1 Three-phase filters

EMC filters are necessary to fulfil EN 50081 if a converter shall be run at a public low voltage line, in Europe for example with 400 V between the phases. Such lines have an earthed neutral conductor. ABB offers suitable three - phase filters for 400 V and $25 \mathrm{~A} . . .600 \mathrm{~A}$ and 500 V filters for 440 V lines outside Europe. Lines with 500 V to 1000 V are not public. They are local lines inside factories, and they do not supply sensitive electronics. Therefore converters do not need EMC filters if they shall run with 500 V and more.

### 9.5.2 Single-phase filters

Many field supply units are single - phase converters for up to 50 A excitation current. They can be supplied by two of the three input phases of the armature supply converter. Then a field supply unit does not need its own filter. If the phase voltage to the neutral conductor shall be taken ( 230 V in a 400 V line) then a separate single-phase filter is necessary. ABB offers such filters for 250 V and 6... 55 A.

| Filter type | max. <br> voltage | $\mathrm{I}^{\mathrm{N}}$ | Terminals <br> for wires <br> with max. <br> dimension | Weight | PE <br> con- <br> necti- <br> on |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  | $[\mathrm{V}]$ | $[\mathrm{A}]$ | $\left[\mathrm{mm}^{2}\right]^{*}$ | $[\mathrm{~kg}]$ |  |
|  |  |  |  |  |  |
| NF1-250-8 | 250 | 8 | 4 | 0.7 | M 6 |
| NF1-250-12 | 250 | 12 | 4 | 0.9 | M 6 |
| NF1-250-20 | 250 | 20 | 4 | 1.0 | M 6 |
| NF1-250-30 | 250 | 30 | $10 / 16$ | 1.0 | M 6 |

## Further Explanation of Filters

## Overload Capacity

Magnetic Limit Currents (Surge Current)

| Filter Type | Maximum Surge Current <br> IDCmax (average) |
| :--- | ---: |
| NF3-xxx-25 | 80 A |
| NF3-xxx-50 | 130 A |
| NF3-xxx-64 | 170 A |
| NF3-xxx-80 | 160 A |
| NF3-xxx-110 | 220 A |
| NF3-xxx-320 | 600 A |
| NF3-xxx-600 | 1200 A |

## Thermal Limit Current

The thermal time constant of the converter is smaller than the thermal time constant of the filter, if the filter is chosen according to the tables in appendix $A$.

In particular cases (e.g. a special load diagram as shown in the figure below the required filter current can be calculated with the following equation:
$I_{\text {filter (eff.rated) }} \geq 0.82 \cdot \sqrt{\frac{1}{T} \cdot\left(I_{1}^{2} \cdot t_{1}+I_{2}{ }^{2} \cdot t_{2}+\ldots+I_{n}{ }^{2} \cdot t_{n}\right)}$.

Example of load diagram

Environmental Conditions
Ambient operating temperature: $0 \ldots+40^{\circ} \mathrm{C}$
Derating:
Storage temperature:
Cooling method:
above $40^{\circ} \mathrm{C}$ same derating as for the converter
$-25 . . .+80^{\circ} \mathrm{C}$
natural air cooling

## Appendix A

Optical cables

For the bus communication of the DCS converters
there are different optical cables available.

| Kind of cable | Connector | cable length | Ident. no. | Fig. |
| :--- | :--- | :---: | :---: | :---: |
| plastic fibre optic single cable | plug | $0.5 \ldots 20 \mathrm{~m}$ | 3ADT 693324 | 1 |
| plastic fibre optic double cable | plug | $0.5 \ldots 20 \mathrm{~m}$ | 3ADT 693318 | 2 |
| HCS silica (double) without plastic jacket | plug | $30 \ldots . .50 \mathrm{~m}$ | 3ADT 693355 | 3 |
| HCS silica (double) with plastic jacket | plug | $50 \ldots 200 \mathrm{~m}$ | 3ADT 693356 | 4 |
| Glass fibre optic (double) reinforced | FSMA | $10 \ldots 100 \mathrm{~m}$ | 3ADV 300002 | 5 |

III A-1

DC Drives Product Portfolio

DCS 400
The drive module for standard applications

- Integrated field supply (max. 20 A)
- Accurate speed and torque control
- Extremely small and compact design
- Very easy installation and commissioning
- Express delivery
- Power range: 10... 500 kW (13... 670 HP)

DCS 500B / DCS 600
The drive module for demanding applications

- Free programming of software
- 6- and 12-pulse configuration up to $10 \mathrm{MW} /$ $13,000 \mathrm{HP}$ and more
- Plain text display
- Power range: 10... 5000 kW (13... 6700 HP )

DCE 500 / DCE 600

DCS 400 / DCS 500
Easy Drive
The complete standard cabinet solution

- Pre-engineered
- Easy installation and commissioning
- Protection class: IP 21
- Plain text display
- Short delivery time
- Power range: 50 ... $1350 \mathrm{~kW}(65 . . .1800 \mathrm{HP}$ )

Highly integrated panel

- Excellent upgrade or revamp solution
- Excellent
- DCS 500B / DCS 600 module
- AC fuses
- Auxiliary transformer
- Motor fan starter with protection
- Main contactor
- Power range: 10... 130 kW (26... 300 HP )

DCA 500 / DCA 600
For complex, completely engineered Drive
System in common cabinet design

- Flexible and modular hardware structure
- 6- and 12-pulse configuration up to $18 \mathrm{MW} /$ 23,000 HP and more
- Pre-programmed applications:

Metals, Cranes, P\&P application, Mining

- Power range: $10 \ldots . .18000 \mathrm{~kW}(13 \ldots 23000 \mathrm{HP})$

Since we aim to always meet the latest state-of-theart standards with our products, we are sure you will understand when we reserve the right to alter particulars of design, figures, sizes, weights, etc. for our equipment as specified in this brochure.
